

Case Study for installing a GSM gateway into offices of a National Building Society with 110 UK sites linked to head office via MPLS

A UK building society is tasked with reducing the cost of their fixed to mobile calls across 110 offices by circa 50%. They have an MPLS network connecting all offices back to their head office in the north of England.

By installing a 2N Stargate PRI GSM gateway into their head office and having all calls to mobiles route over their internal MPLS network and then break out from head office, call costs are reduced from 10.15p to 4.75p a minute. Hardware costs are minimal compared to a stand alone non MPLS solution, whereby each office would need separate hardware installed.
